### Vol 28 - No 30 HAZARD AWARENESS

Being aware of the hazards that are around us everyday is part of a good safety program. Sharp objects like glass, protruding electric wires or nails can be found on every job site. So one must review the job site / work area for a moment before work begins to look for hazards that could result in an accident.

For example, a maintenance worker who was storing extra plate glass with sharp edges in the mechanical room of a building (picture 1). When an electrician who was working in the same room walked to close to the glass (picture 2), he received a laceration that required several stitches (picture 3). If he had taken a moment to survey the scene, he may have noticed the hidden danger and corrected or avoided it.
