PERSONAL PROTECTIVE EQUIPMENT

When it comes to safety, the most important tool you have is your Personal Protective Equipment. From your hard hat to your toe guards, there is a proper protection for every part of your body, depending on the job you are going to do.

As required by OSHA, the proper or adequate Personal Protective Equipment (PPE) shall be used by all employees to maintain an acceptable limit of exposure to any possibly hazardous substances, work actions or conditions.

Employers should ensure that all employees receive proper training in the use and maintenance of the PPE that they are going to use. Employees should be able to recognize defective equipment and know that it should not be used until properly repaired. The correct use and proper maintenance of personal protective equipment will greatly reduce the risk of accidents to workers.

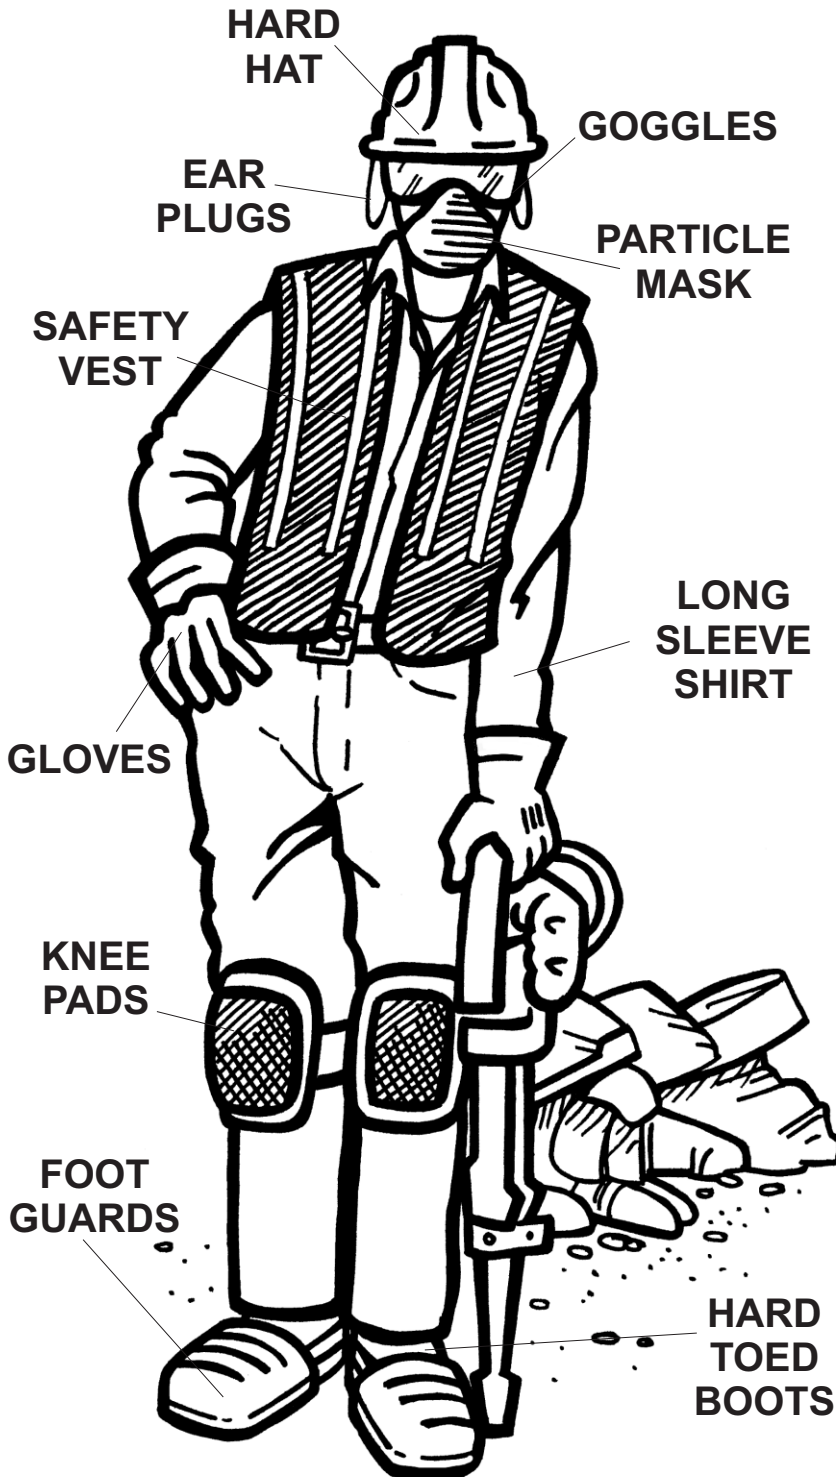

The proper type of PPE that is required for a specific job should be determined by the supervisors hazard assessment plan. By anticipating the work that is going to be performed, the employer should be able to furnish the correct PPE for the job.

Personal Protective Equipment, used properly and wisely, will ensure safe working conditions for employees.
